INTRODUCING THE PRODUCTS MADE OF THE WHEAT STRAW PLASTIC

Plastic has an amazing carbon intensity life cycle. Most plastic resins come from petroleum and to be extracted. The resin is then made into products and shipped to the market. All of these processes emit greenhouse gases either directly or through the energy required to complete them. Plastic's carbon footprint continues even after we've finished disposing of it. Both dumping and burning emit carbon dioxide.

ABOUT WHEAT STRAW PLASTIC

When wheat straw is used to make plastic, it becomes compostable and can decompose in a home or commercial site, and this plastic is entirely biodegradable.
